

# **Experimental evaluation of a high-speed multi-megawatt SPM machine**

**Daniel M. Saban, PE PhD**  
**saban@ieee.org**

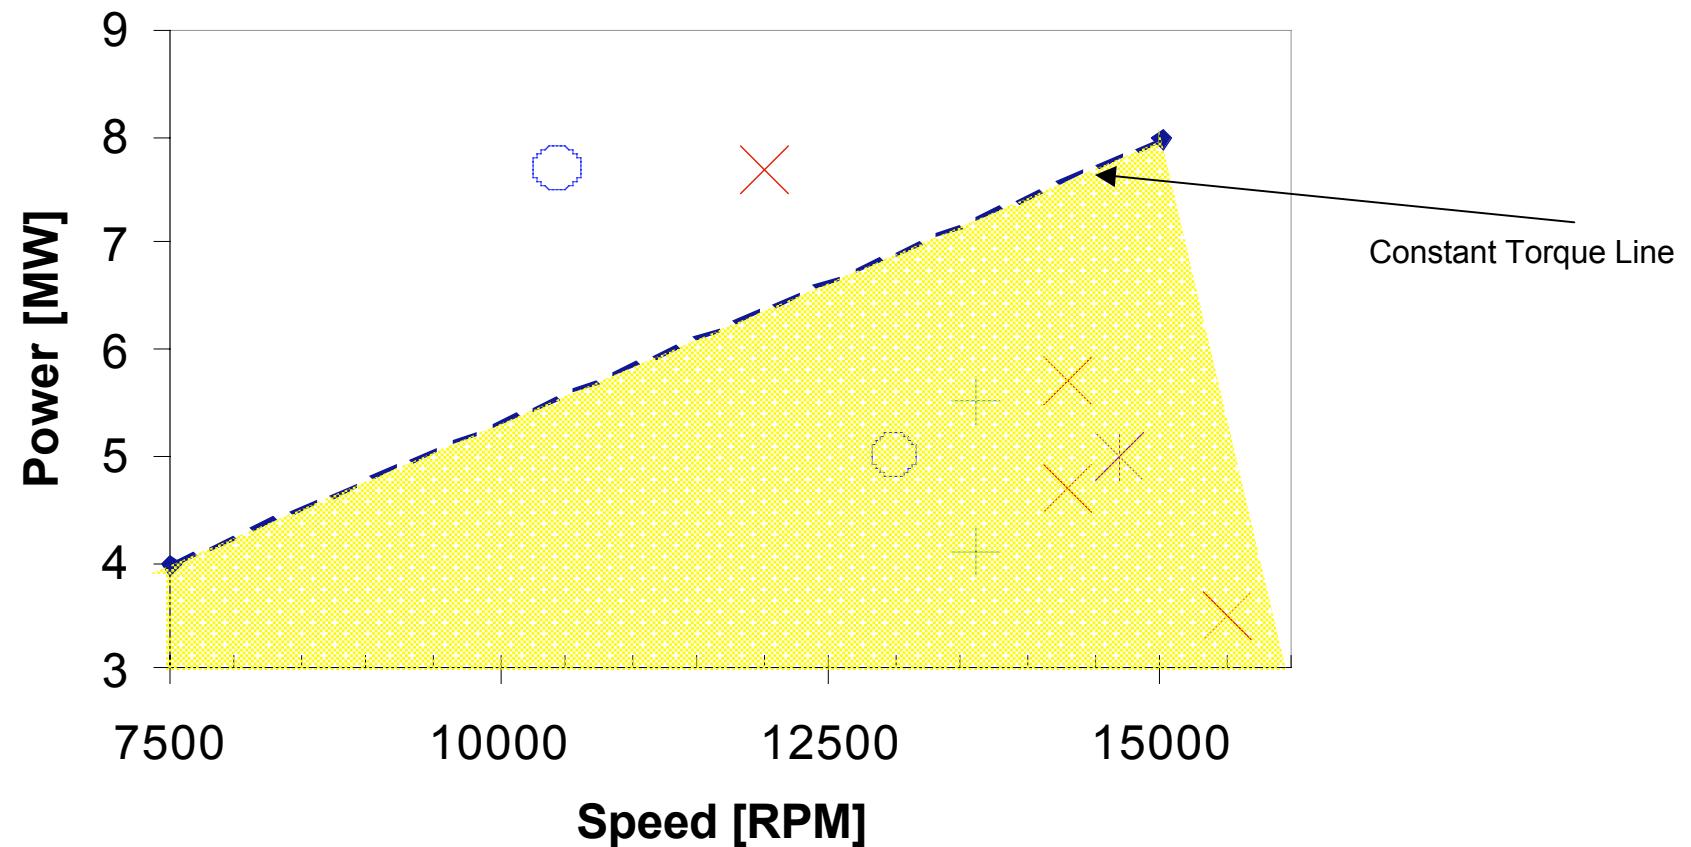

# Agenda

- ◆ Machine Description
- ◆ Testing
  - ◆ Stator-only
  - ◆ Open circuit
  - ◆ No-load
  - ◆ Short circuit
  - ◆ Partial load, full speed generating
- ◆ Analysis
- ◆ Conclusion

# Frame 8 Product Family

- ◆ Highlighted area is capability envelope of product family
- ◆ Maximum electrical loading along constant torque line

# Frame 8 Machine

- ◆ Envelope

- ◆ 43.8 in (13350mm) tall
- ◆ 41.5 in (12469mm) wide
- ◆ 85.4 in (25969mm) long

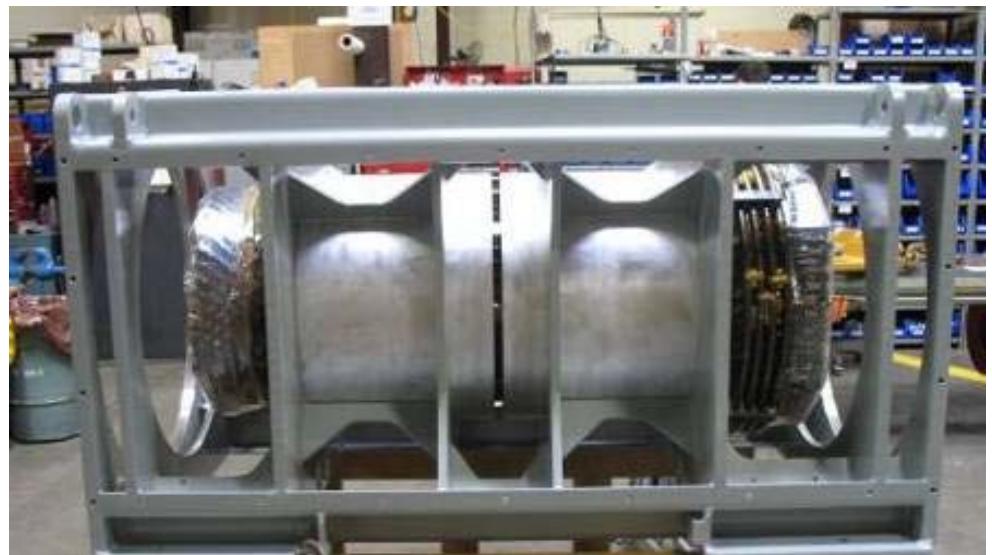

- ◆ Weight 8,975 lbs (4,071kg)

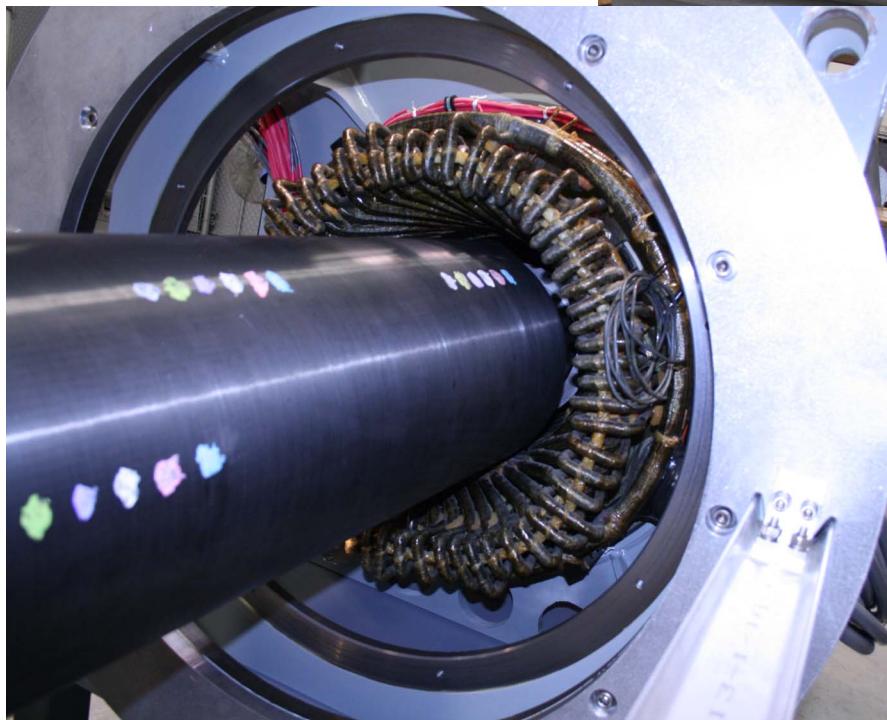

# Frame 8 Stator and Housing

- ◆ Built by Kato Engineering
  - ◆ Collaborative design
  - ◆ Robust stator design and manufacture
  - ◆ Proven insulation system

# Frame 8 Final Assembly

- ◆ Rotor insertion at DDS facility
- ◆ Special insertion tooling developed by DDS

# Frame 8 Demonstration Unit

- ◆ Insulation system
  - ◆ Class H designed for class F temperature rise
  - ◆ Tested up to 10kV and 800Hz
- ◆ Oil lubricated ceramic ball bearings in squeeze film damper resilient mounts
- ◆ Machine Rating
  - ◆ Generator (demo): 4.2kV, 2.8MW, unity PF, 97.5% eff, 15kRPM
  - ◆ Generator (expected): 3.6kV, 6.1MW, 0.98 PF, 98.2% eff, 15kRPM
  - ◆ Motoring (expected): 5.5kV, 7.5MW, 0.80 PF, 98.1% eff, 15kRPM
- ◆ Cooling System
  - ◆ Forced air cooling over each end turn and through mid-stack vent
  - ◆ Closed circuit water/glycol cooling through pressed-on aluminum cooling jackets over stator back iron
  - ◆ Individual valves per each cooling jacket
  - ◆ Separate fans for mid-stack and end-turn air

# Electromagnetic Design

- ◆ High-frequency considerations
  - ◆ Iron core loss (eddy and hysteresis)
  - ◆ Copper eddy loss
  - ◆ Rotor eddy loss (magnets and hub/shaft)
- ◆ Stator configuration
  - ◆ Thinly laminated, low-loss silicon steel
  - ◆ Multi-stranded, form-wound coils
- ◆ Rotor configuration
  - ◆ Pre-magnetized, segmented magnets
  - ◆ Large magnetic gap
- ◆ Need to balance manufacturing costs and complexity with loss reduction
  - ◆ Wroebel conductors or Litz wire
  - ◆ Magnetic slot wedges
  - ◆ Size of rotor segments

# Stator Only Thermal Model

	Iron Loss [kW]	Slot Cu Loss [kW]	End-turn Cu Loss [kW]	Total losses [kW]
CFD Model	10.52	8.28	3.72	22.52

Solid Temp. [°C]

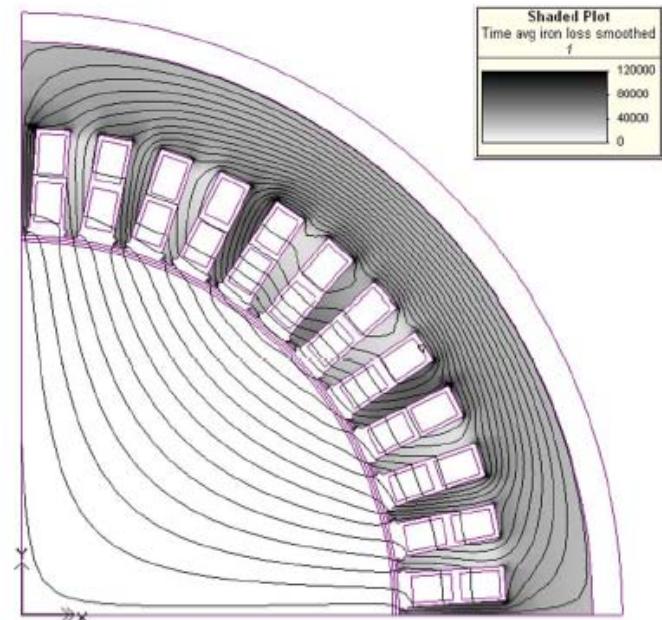

150

90

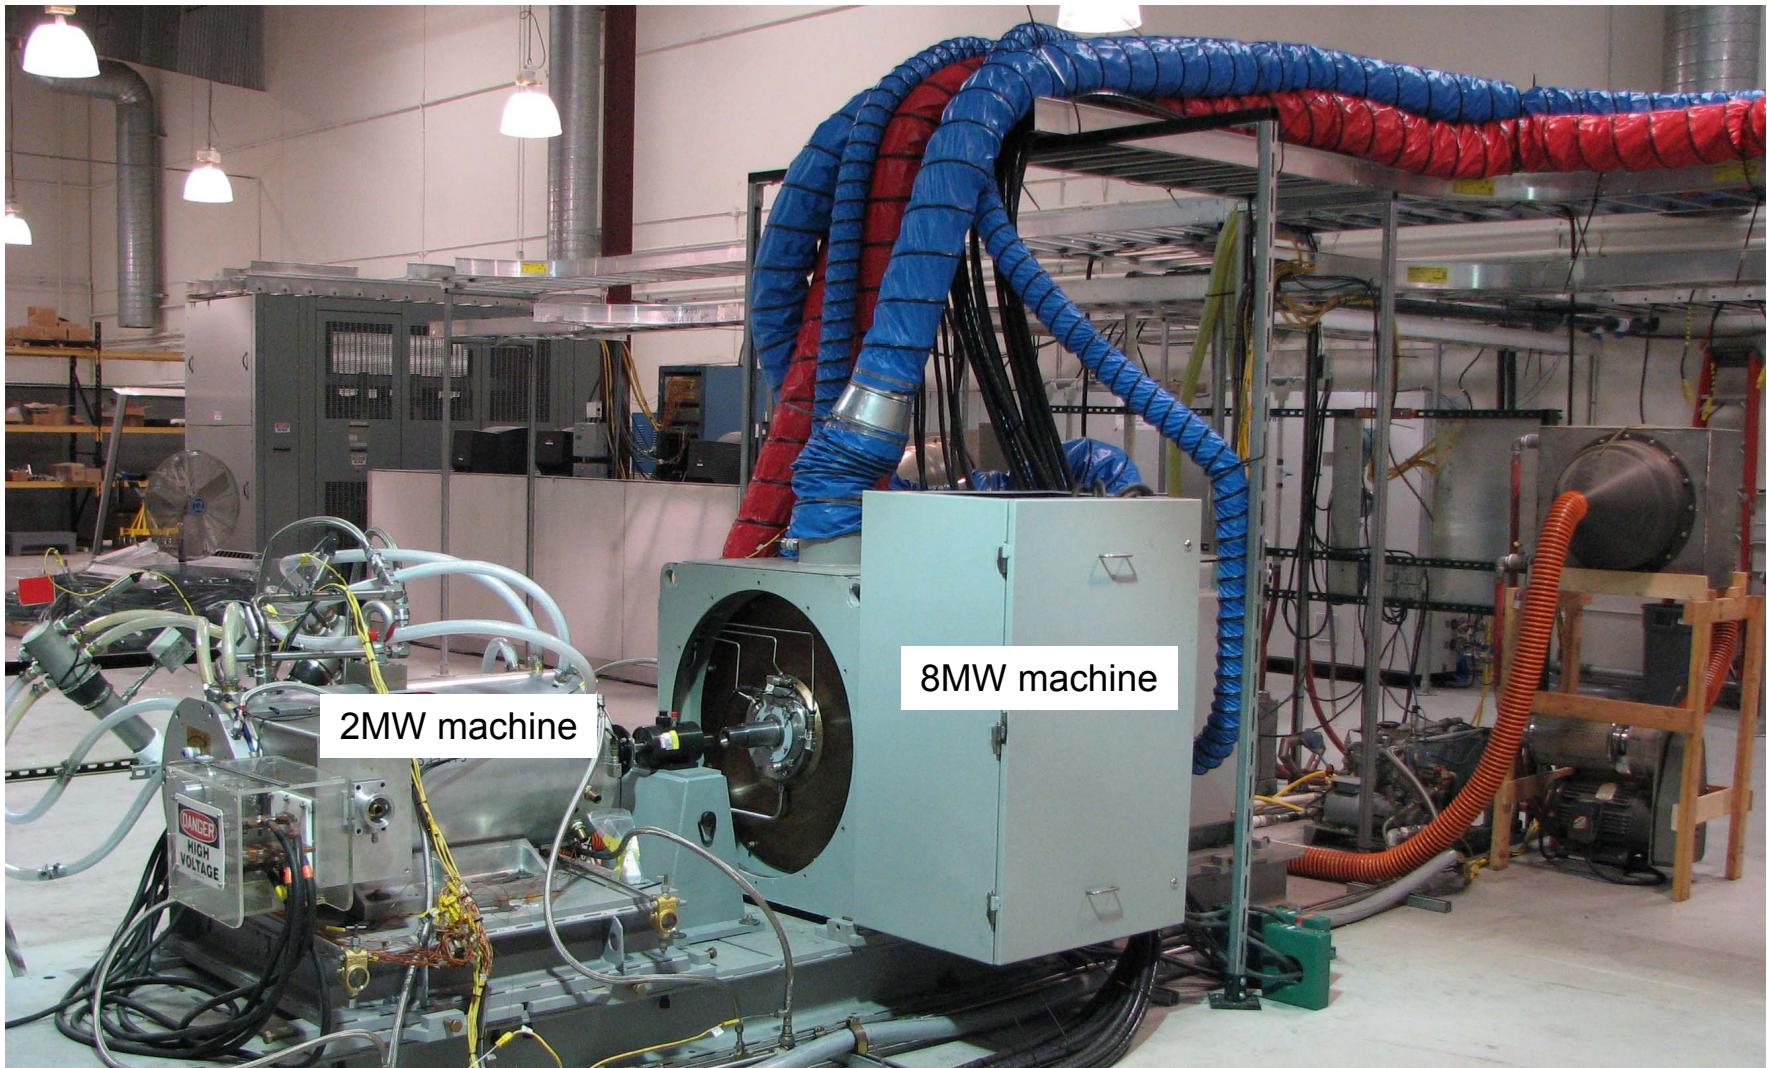

30

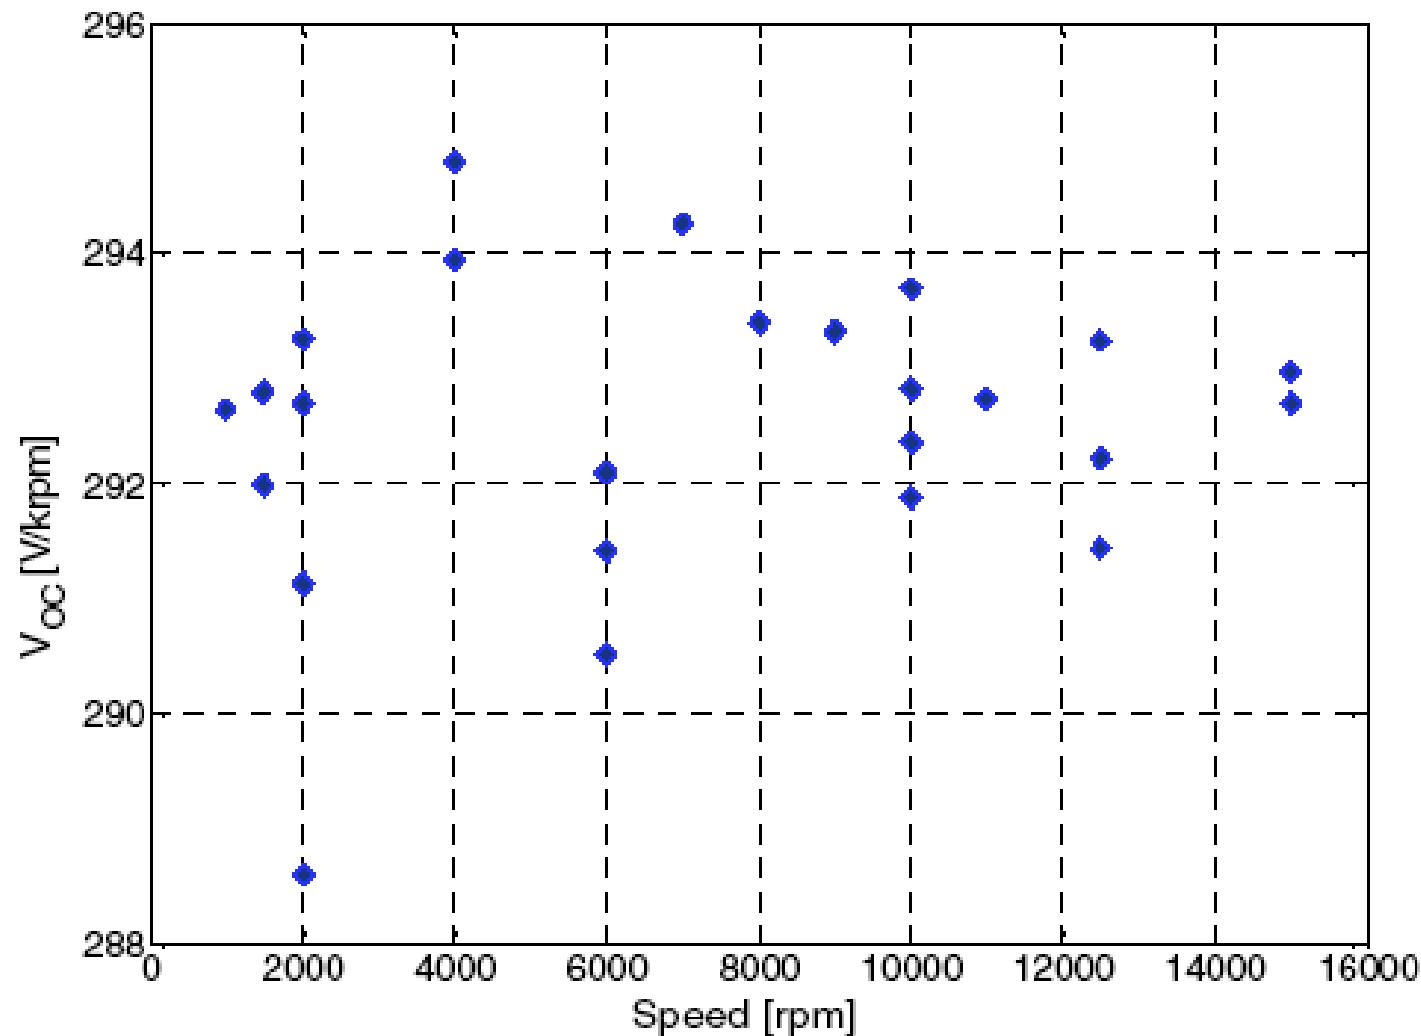

- ◆ 60Hz, 1000A
- ◆ FE model predicts <10kW of total loss

# Back-to-back tests

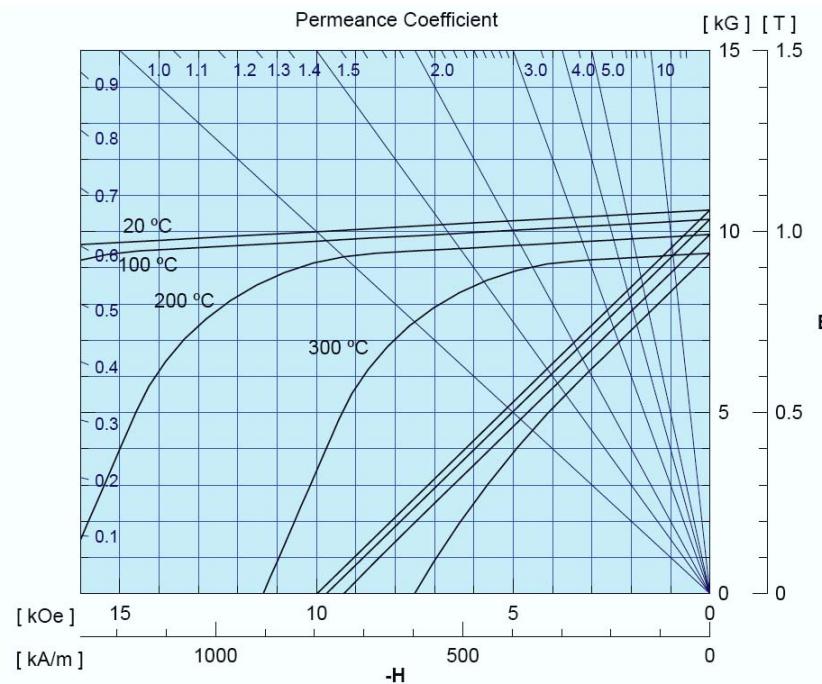

# Open Circuit Voltage

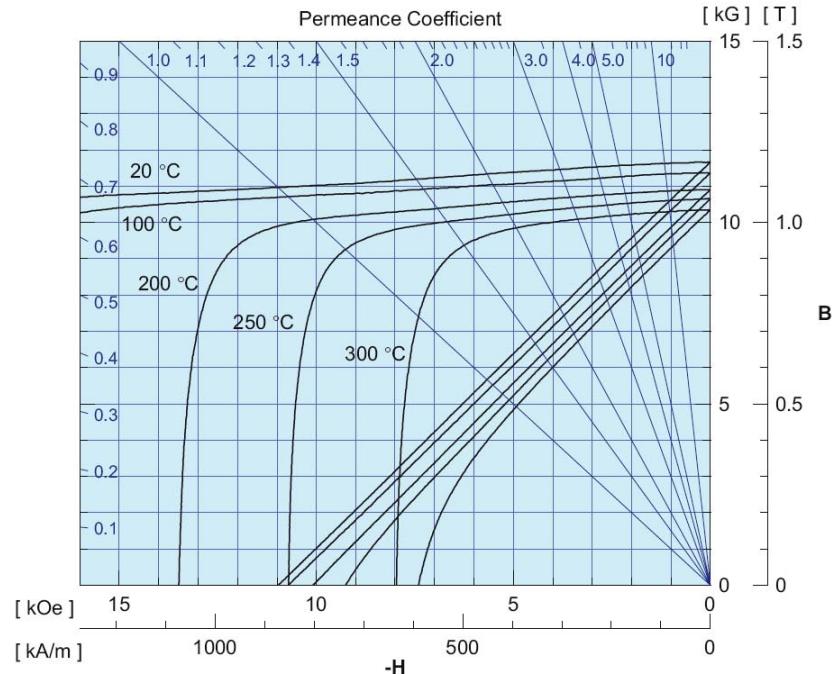

# Magnet Material Data

- ◆ Demagnetization curves at elevated temperature
- ◆ Modern hard magnetic materials resistant to demagnetization within normal operating temperatures

26 MGOe nominal

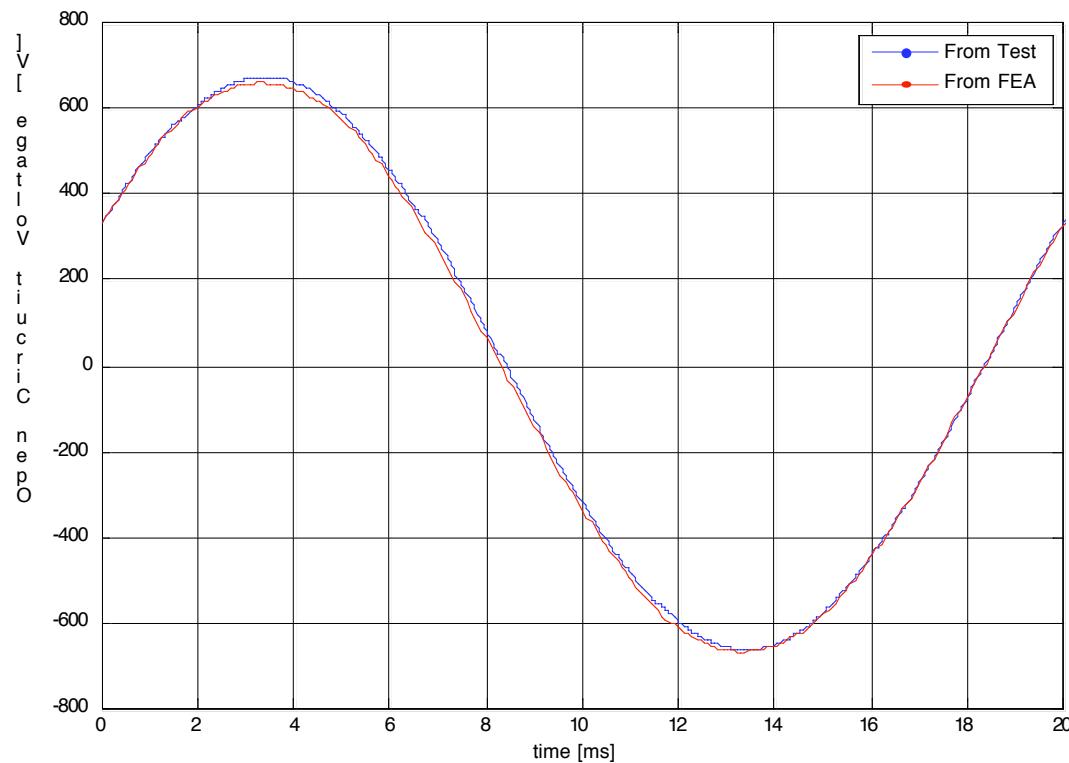

32 MGOe nominal

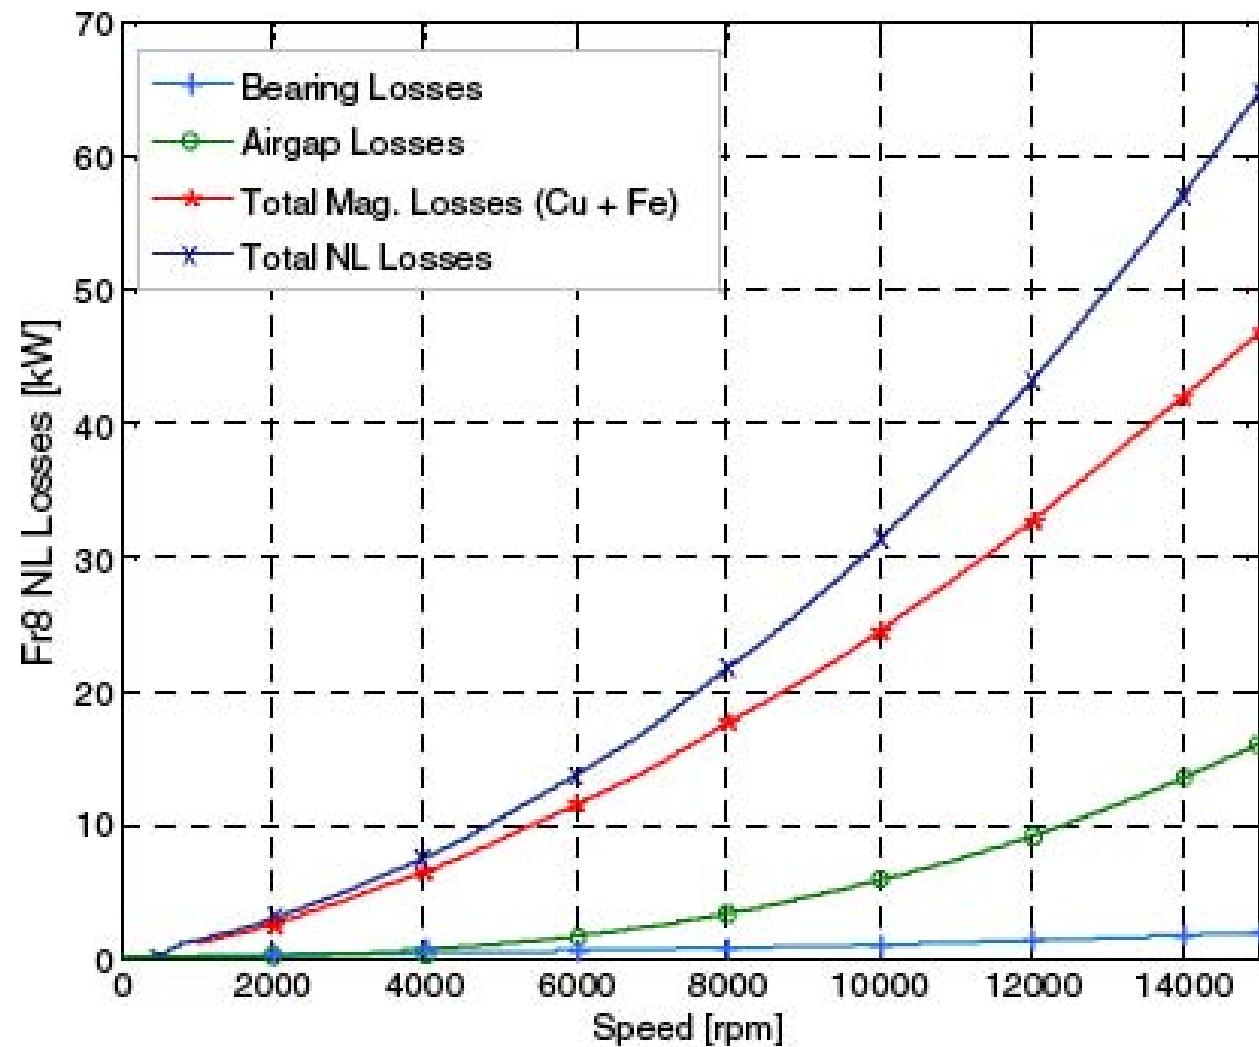

# Open Circuit Voltage

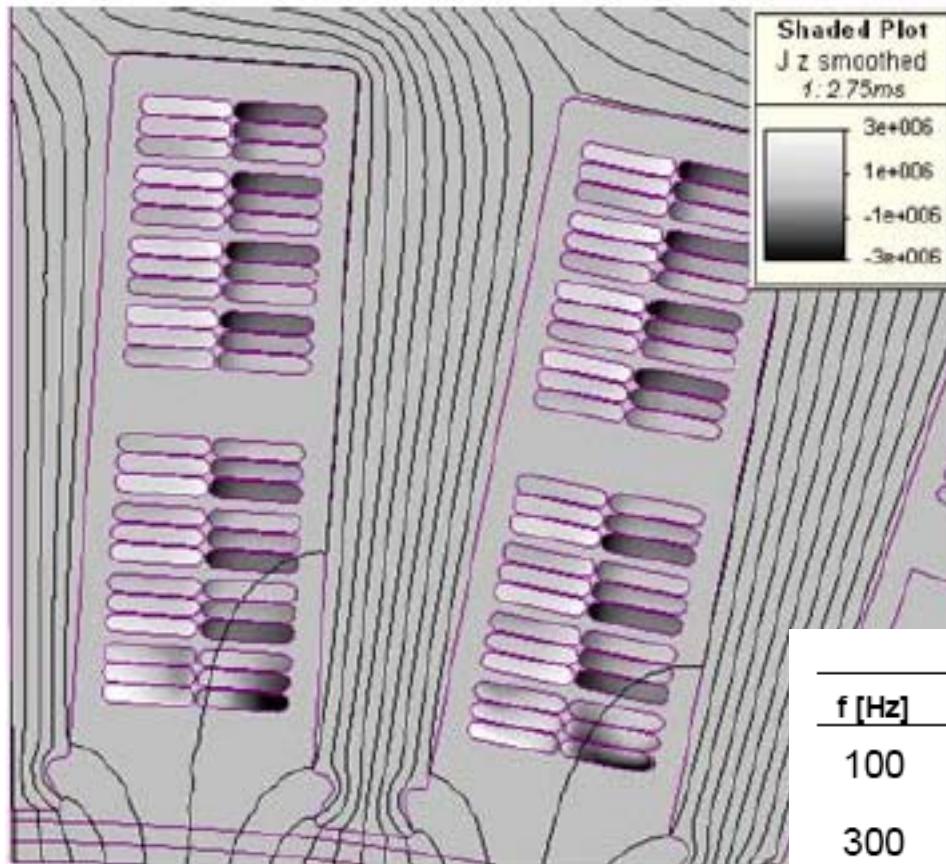

- ◆ FEA pre-build, 20 °C: 4685 V<sub>rms</sub> line-to-line
- ◆ FEA post-build, 20 °C: 4392 V<sub>rms</sub> line-to-line
- ◆ Measured, average: 4378 V<sub>rms</sub> line-to-line

# No-load loss curves

# No-load stator eddy currents

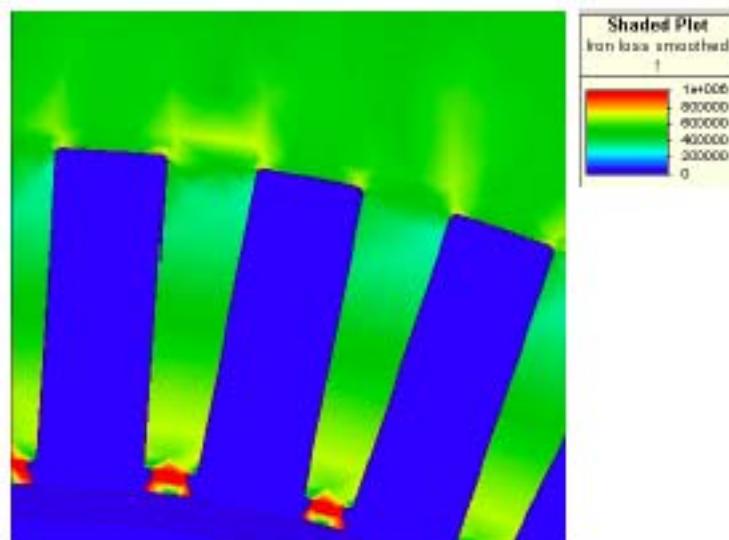

- ◆ Analytical methods widely varied
- ◆ FE ~10kW lower prediction than experimental (correlated w/ CFD)

EDDY CURRENT LOSS IN STATOR COILS						
f [Hz]	FE	CFD	Say [14]	Walker [15]	Shanks [16]	Fink [17]
100	0.32	1.58	18.13	0.08	0.22	4.08
300	2.39	7.47	23.96	0.72	1.99	36.74
400	3.99	11.71	29.07	1.23	3.53	65.34
500	5.91	16.80	35.63	1.98	5.52	102.05

# Iron loss discrepancies

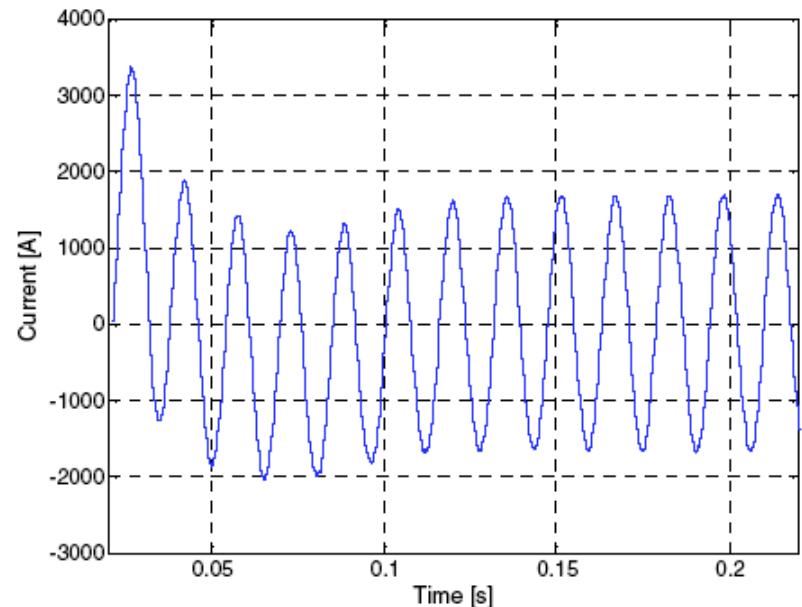

- ◆ University Epstein tests 26% above manufacturer data
- ◆ Independent material testing lab, higher still
- ◆ Independent material lab data used in FE model predicts ~ 9kW lower loss than justified with CFD

# End-reactance & Short Circuit

## ◆ Analytical methods

- ◆ Liwschitz-Garik & Whipple (41.95  $\mu\text{H}$ )
- ◆ Puchstein (38.31  $\mu\text{H}$ )
- ◆ Fowler (41.84  $\mu\text{H}$ )
- ◆ Langsdorf (46.28  $\mu\text{H}$ )
- ◆ Still (125.83  $\mu\text{H}$ )
- ◆ Lipo (84.0  $\mu\text{H}$ )
- ◆ PC-BDC: 8  $\mu\text{H}$
- ◆ SC test - 2D FE: 150  $\mu\text{H}$

# UT Test Configuration

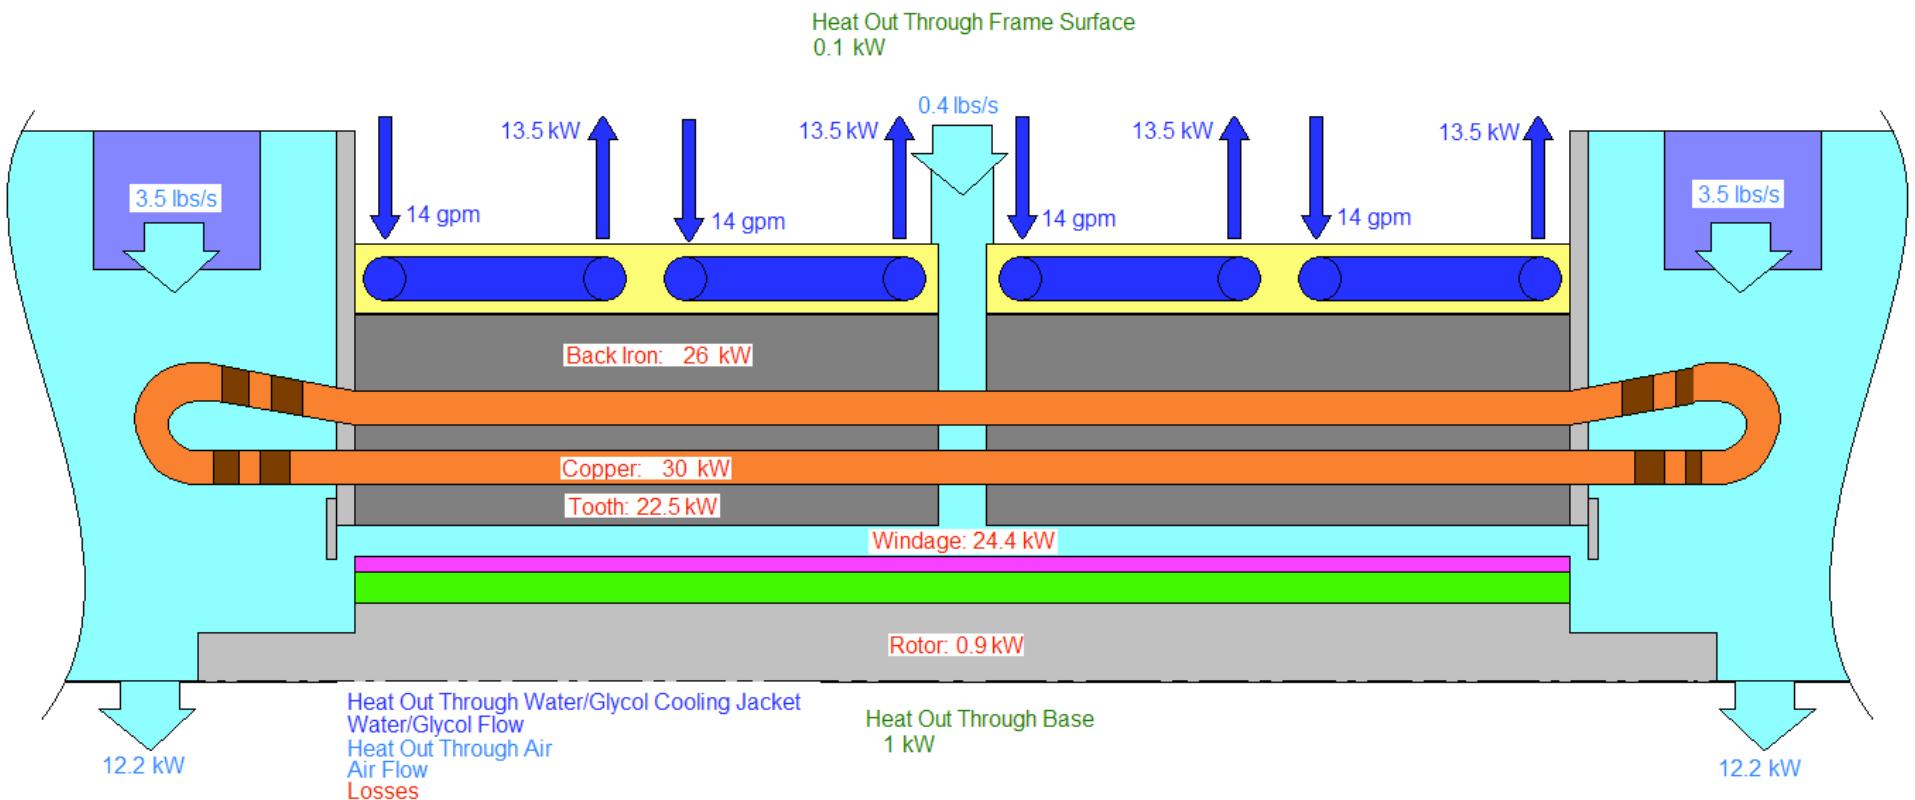

◆ Frame 8 demonstration unit tested as a generator

- ◆ TF-40 turbine as prime mover
  - ISO rating 3MW at 15kRPM
- ◆ 3 MW resistive load bank
- ◆ Disc pack flexible coupling

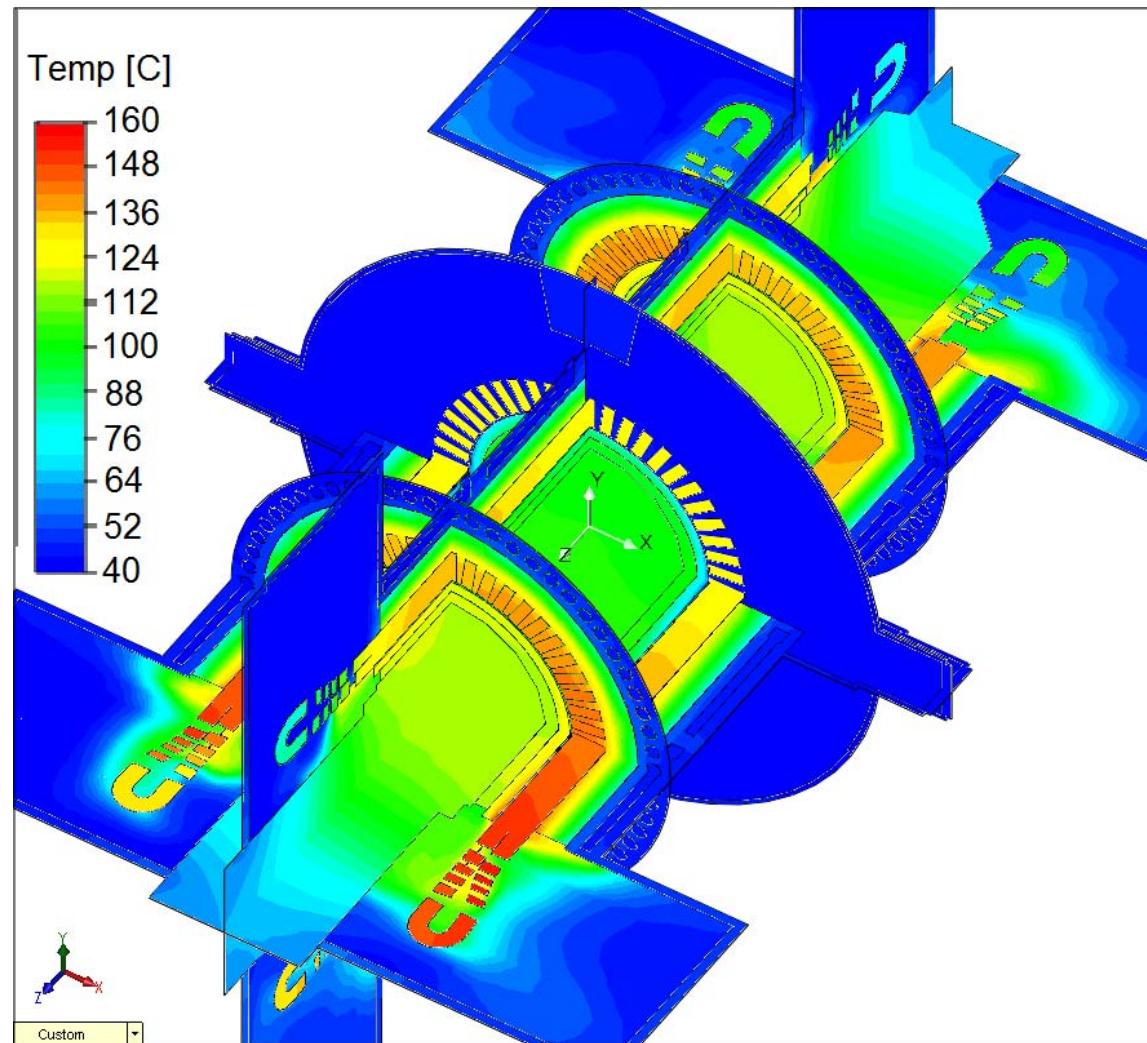

# Machine Cooling

## ◆ Heat Balance Figure

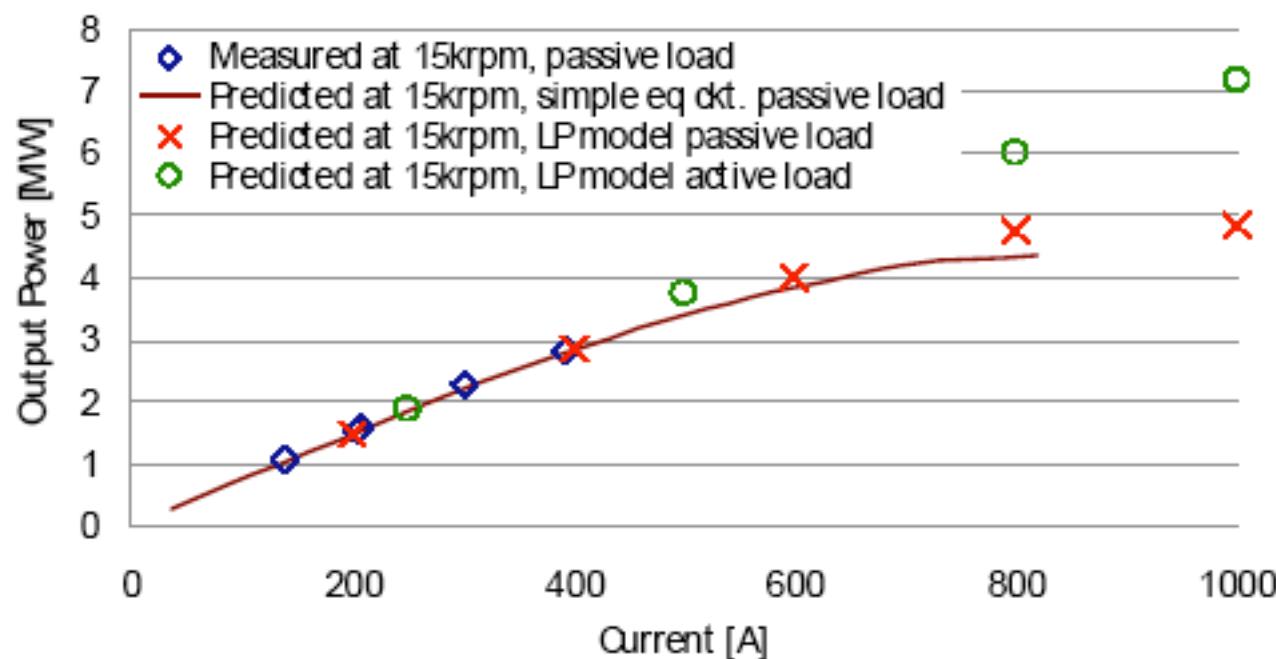

# Machine Cooling

- ◆ Computational fluid dynamics model results

# Generating performance

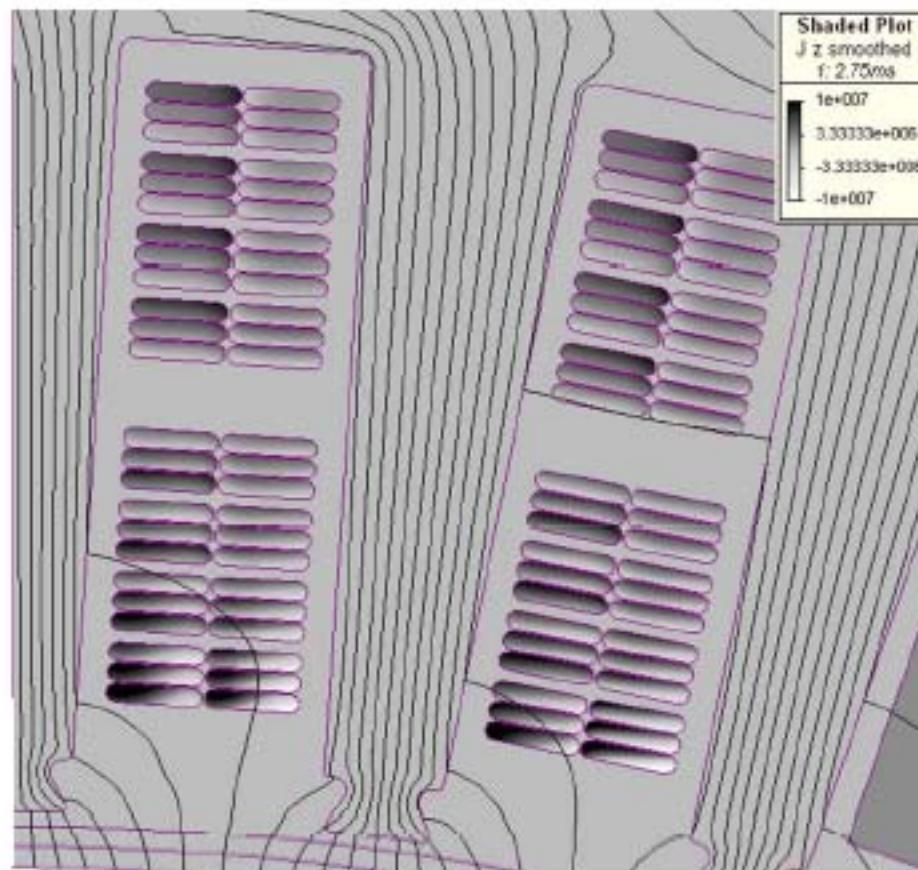

- ◆ Active load significantly improves output power
- ◆ Simple circuit model diverges from LP model
- ◆ Both models track well for low currents

# Stator eddy currents

- ◆ Includes tooth ripple, skin and proximity effects
- ◆ Dwarfs losses due to fundamental, net current

# Loss Segregation

- ◆ Thermal model (CFD) identifies significantly more loss than other tools (FE, LP) predict
- ◆ Both Iron and copper loss miss by ~10kW
- ◆ Discrepancy not principally changed from no-load

LOSS SEGREGATION FOR 3 MW, 15 krpm OPERATION

	Iron Loss [kW]	Slot Cu Loss [kW]	End-turn Cu Loss [kW]	Windage [kW]	Total loss [kW]
CFD Model	33.60	21.2	1.77	17.80	74.37
FE Model	23.77	9.95	1.72	n/a	n/a
LP Model	24.46	1.91	1.71	20.0	48.08

# Conclusions

- ◆ Thermal models can be used for effective allocation of machine losses
- ◆ Commercially available tools are not successful in predicting machine losses *a priori*
- ◆ Both parameter and physics based models can be modified after prototype testing to predict losses
- ◆ Calibrated models can be used to design similar machines
